solution of equations and systems of equations second edition deals with the laguerre iteration interpolating polynomials method of steepest descent and the theory of divided differences the book reviews the formula for confluent divided differences newton s interpolation formula general interpolation problems and the triangular schemes for computing divided differences the text explains the method of false position regula falsi and cites examples of computation using the regula falsi the book discusses iterations by monotonic iterating functions and analyzes the connection of the regula falsi with the theory of iteration the text also explains the idea of the newton raphson method and compares it with the regula falsi the book also cites asymptotic behavior of errors in the regula falsi iteration as well as the theorem on the error of the taylor approximation to the root the method of steepest descent or gradient method proposed by cauchy ensures global convergence in very general conditions this book is suitable for mathematicians students and professor of calculus and advanced mathematics

this book is intended as a text for a problem solving course at the first or second year university level as a text for enrichment classes for talented high school students or for mathematics competition training it can also be used as a source of supplementary material for any course dealing with algebraic equations or inequalities or to supplement a standard elementary number theory course there are already many excellent books on the market that can be used for a problem solving course however some are merely collections of problems from a variety of fields and lack cohesion others present problems according to topic but provide little or no theoretical background most problem books have a limited number of rather challenging problems while these problems tend to be quite beautiful they can appear forbidding and discouraging to a beginning student even with well motivated and carefully written solutions as a consequence students may decide that problem solving is only for the few high performers in their class and abandon this important part of their mathematical and indeed overall education

first course in the theory of equations is an educational mathematics textbook that introduces students to the study of polynomial equations and their properties the book covers topics such as the roots of equations relationships between roots and coefficients symmetric functions factorization and methods for solving quadratic cubic and quartic equations along with the fundamental theorem of algebra written with clarity and a focus on problem solving it provides worked examples and techniques to help beginners build a solid foundation in algebra serving as a stepping stone to more advanced studies in abstract algebra and higher mathematics purpose introduces students to the theory of polynomial equations and their solutions key topics roots of polynomial equations relationships between roots and coefficients symmetric functions of roots approach emphasizes clear explanations worked examples and practical problem solving techniques audience undergraduate students or beginners studying algebra and the theory of equations impact provides a solid foundation for advanced algebra and higher mathematics studies

unlike the classical sturm theorems on the zeros of solutions of second order odes sturm s evolution zero set analysis for parabolic pdes did not attract much attention in the 19th century and in fact it was lost or forgotten for almost a century briefly revived by pólya in the 1930 s and rediscovered in part several times since it was not until the 1980 s that the sturmian argument for pdes began to penetrate into the theory of parabolic equations and was found to have several fundamental applications geometric sturmian theory of nonlinear parabolic equations and applications focuses on geometric aspects of the intersection comparison for nonlinear models creating finite time singularities after introducing the original sturm zero set results for linear parabolic equations and the basic concepts of geometric analysis the author presents the main concepts and regularity results of the geometric intersection theory g theory here he considers the general singular equation and presents the geometric notions related to the regularity and interface propagation of solutions in the general setting the author describes the main aspects of the ode pde duality proves existence and nonexistence theorems establishes uniqueness and optimal bernstein type estimates and derives interface equations including higher order equations the final two chapters explore some

special aspects of discontinuous and continuous limit semigroups generated by singular parabolic equations much of the information presented here has never before been published in book form readable and self contained this book forms a unique and outstanding reference on second order parabolic pdes used as models for a wide range of physical problems

this monograph is devoted to the construction of optimal estimates of values of linear functionals on solutions to cauchy and two point boundary value problems for systems of linear first order ordinary differential equations from indirect observations which are linear transformations of the same solutions perturbed by additive random noises it is assumed that right hand sides of equations and boundary data as well as statistical characteristics of random noises in observations are not known and belong to certain given sets in corresponding functional spaces this leads to the necessity of introducing the minimax statement of an estimation problem when optimal estimates are defined as linear with respect to observations estimates for which the maximum of mean square error of estimation taken over the above mentioned sets attains minimal value such estimates are called minimax or guaranteed estimates it is established that these estimates are expressed explicitly via solutions to some uniquely solvable linear systems of ordinary differential equations of the special type the authors apply these results for obtaining the optimal estimates of solutions from indirect noisy observations similar estimation problems for solutions of boundary value problems for linear differential equations of order n with general boundary conditions are considered the authors also elaborate guaranteed estimation methods under incomplete data of unknown right hand sides of equations and boundary data and obtain representations for the corresponding guaranteed estimates in all the cases estimation errors are determined
